1. Introduction

A CRM Application for The Chai Shop & Co

A Customer Relationship Management (CRM) application is a system used to collect, organize and manage customer information and interactions. For The Chai Shop & Co, the CRM application brings customer details, purchases, preferences, loyalty activities and feedback into one organized system.

Main Objectives

- Maintain a centralized customer database.
- Record customer orders and purchase history.
- Manage loyalty points, rewards and customer offers.
- Collect and manage feedback and complaints.
- Generate useful customer and business reports.
- Improve customer retention and repeat purchases.

Project Scope

The proposed CRM focuses on the customer relationship side of the tea shop. It connects customer registration, purchase records, loyalty, feedback and reporting so that staff can view useful information from a common system. The project is designed as a practical application concept that can be adapted to the shop's day-to-day operations.

2. Core Features & System Modules

Five connected modules

Module 1: Customer Management

- Customer registration and profile creation
- Store contact details and preferences
- Search and update customer records
- View customer interaction history

Module 2: Order & Purchase Management

- Record customer orders and purchases
- Store product, quantity, amount and date
- Track frequently purchased items
- View complete purchase history

Module 3: Loyalty & Offers Management

- Maintain loyalty points and rewards
- Create suitable discounts and offers
- Identify regular customers
- Reward customers based on purchase activity

2. Core Features & System Modules

Modules 3–5

Module 3: Loyalty & Offers Management

This module maintains loyalty points and rewards for customers. It can record reward eligibility and support offers based on customer activity. The main purpose is to maintain a continuous relationship with repeat customers.

Module 4: Feedback & Support Management

- Collect ratings and reviews
- Record complaints and service issues
- Track issue status
- Use feedback to improve service

Module 5: Reports & Analytics

- Customer and sales summaries
- Repeat-customer analysis
- Popular-product and order trends
- Loyalty and feedback reports
- Support business planning

Module Integration

The five modules are connected. Customer information is used when an order is recorded; purchase activity can update loyalty information; feedback is linked to the customer record; and the combined information can be used in reports and analytics.

3. Customer Journey Workflow

How a customer moves through the CRM

1	Customer Visits / Discovers Shop
↓	Customer Registration
↓	Order & Purchase
↓	Purchase History Updated
↓	Feedback / Rating
↓	Personalized Offer / Loyalty Reward
↓	Repeat Purchase
↓	Loyal Customer

Workflow Explanation

The customer first visits or discovers the shop. Registration creates a customer profile. When an order is placed, the purchase details are stored. The purchase history can then support loyalty activities and relevant offers. Customers can provide ratings or feedback, and the CRM keeps this information for support and improvement. Continued engagement may lead to repeat purchases and a stronger long-term relationship.

4. Business Benefits for The Chai Shop & Co

Benefit	How It Helps
Better Customer Management	Customer information is maintained in one organized system.
Personalized Experience	Purchase history and preferences support relevant service and offers.
Customer Retention	Loyalty rewards and follow-up can encourage repeat visits.
Improved Sales Opportunities	Purchase patterns can help identify suitable promotions.
Faster Support	Feedback and complaints can be tracked until resolution.
Data-Driven Decisions	Reports help understand customer and sales trends.
Reduced Manual Work	Digital records reduce dependence on scattered manual records.
Stronger Relationships	Regular engagement and personalized service support long-term relationships.

Conclusion

The CRM application connects customer information, purchases, loyalty, feedback and analytics into one system. It helps The Chai Shop & Co understand customers, improve service and build stronger long-term customer relationships.

5. Customer Database & Information Flow

Customer Profile

A customer profile is the central record used by the CRM. It may contain customer name, contact information, preferences, purchase history, loyalty details and feedback records. Keeping these details together makes customer information easier to access and update.

Main Information Stored

- Customer ID – unique identification for each customer.
- Name and contact details – basic customer information.
- Preferences – useful information about commonly selected products or services.
- Purchase history – previous orders, quantities, amounts and dates.
- Loyalty information – points, rewards and offer activity.
- Feedback – ratings, reviews, complaints and support status.

Information Flow

Customer → Registration → Customer Profile → Order Record → Purchase History → Loyalty/Offer Update → Feedback → Reports & Analytics

This flow shows how information moves through the proposed CRM. The customer record acts as the common reference point for different activities.

6. Detailed Working of the Five Modules

Module 1 – Customer Management

Staff can create a new customer profile, update existing details and search for customer records. Interaction history can be reviewed when service is provided.

Module 2 – Order & Purchase Management

Every purchase can be associated with the customer profile. Product, quantity, amount and date can be maintained so that the shop can view purchase history and identify frequently purchased items.

Module 3 – Loyalty & Offers

The module maintains loyalty points and rewards. It can support suitable offers for regular customers and connect rewards with purchase activity.

Module 4 – Feedback & Support

Customer ratings, reviews and complaints can be recorded. An issue can be tracked until its status is updated or resolved.

Module 5 – Reports & Analytics

The reporting module combines available CRM information to produce customer, sales, repeat-purchase, loyalty and feedback summaries. These reports can support business planning.

7. CRM System Architecture

Proposed Logical Architecture

Customer / Staff	CRM Application
Customer Registration	Customer Management
Orders & Purchases	Order Management
Loyalty Activity	Loyalty & Offers
Ratings / Complaints	Feedback & Support
Reports / Summaries	Reports & Analytics

Architecture Explanation

The customer or staff interacts with the CRM application. The application provides access to the five connected modules. Data created in one module can support activities in other modules. For example, an order creates purchase history, purchase activity can support loyalty information, and the combined information can be used by the reporting module.

Data Relationship Example

Customer Profile → Order → Purchase History → Loyalty Activity → Offer/Reward → Repeat Purchase. Feedback can be linked to the same customer profile and used along with the other records.

8. Reports, Analytics & Decision Support

The CRM can organize information into useful summaries. Reports do not replace business decisions; they provide structured information that can be reviewed by the shop.

Customer Reports

- Number of registered customers
- Customer activity summaries
- Repeat-customer records
- Customer preference information

Sales & Purchase Reports

- Purchase frequency
- Frequently purchased products
- Order amount and date summaries
- Purchase history by customer

Loyalty & Feedback Reports

- Loyalty points and reward activity
- Offer activity
- Ratings and reviews
- Open and resolved support issues

Use of Analytics

These reports can help the shop understand customer activity, monitor service issues, review repeat purchases and support planning. The usefulness of the analysis depends on the accuracy and completeness of the information entered into the CRM.

9. Implementation Summary & Future Scope

Implementation Summary

The proposed CRM application can be implemented as a connected system containing customer, order, loyalty, feedback and reporting modules. A centralized customer record provides the base for maintaining interactions and purchase information. The workflow begins with customer registration and continues through purchases, feedback, loyalty activity and repeat engagement.

Suggested Implementation Steps

- Define the customer and business information that must be stored.
- Create the customer management module and customer records.
- Add order and purchase management.
- Connect loyalty points and offers with purchase activity.
- Add feedback and support tracking.
- Create reports for customer, purchase, loyalty and feedback information.
- Test the complete customer journey from registration to repeat purchase.

Future Scope

- Mobile-friendly access for staff.
- Automated customer notifications and reminders.
- More detailed sales and customer dashboards.
- Additional personalization based on stored preferences.
- Integration with other business systems when required.

Final Conclusion

A CRM application for The Chai Shop & Co provides a structured way to manage customer relationships. By connecting customer records, purchases, loyalty, feedback and analytics, the system can support organized service, customer engagement and business planning.
